

Original B2 column 441: two apex descriptions of the same periodic orbit

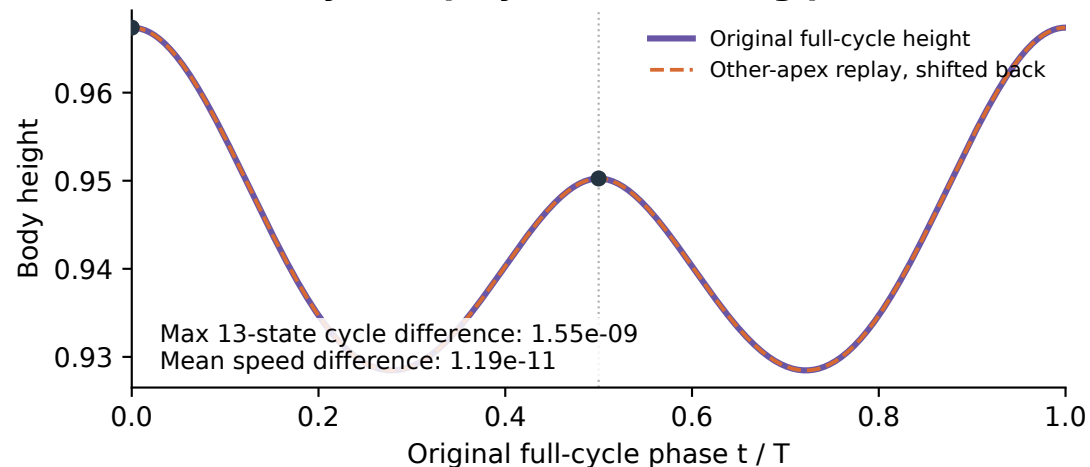

A Gathered apex · original phase 0

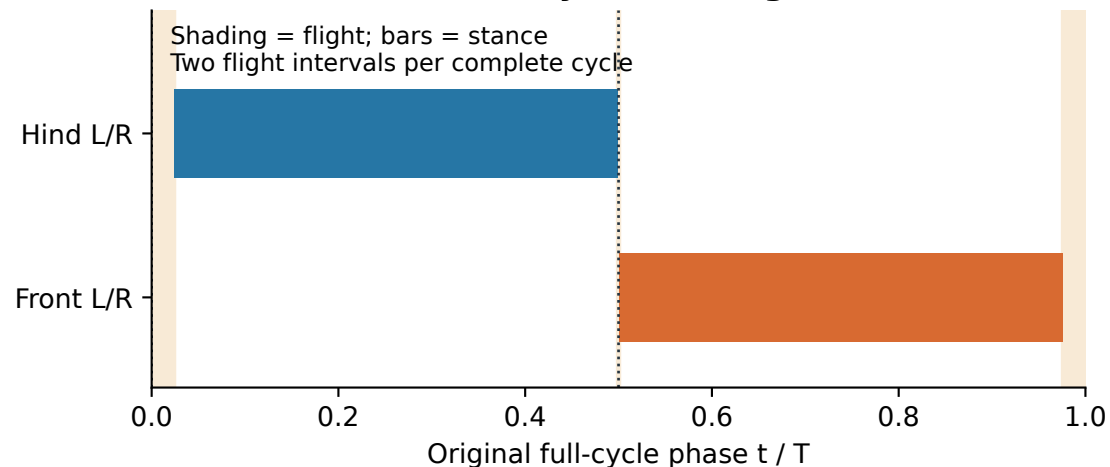

B Extended apex · original phase $\frac{1}{2}$

C Whole-cycle replay after restoring phase

D The contact itinerary is unchanged

$T = 1.704338562$ · phase shift = $T/2 = 0.852169280$ · mean speed = 0.715085696
The horizontal origin is reset at each apex. The complete period and leg-event schedule are retained; this is not a new bifurcation.
