

Independent full 12-state Floquet check of the BIP connection

A Standing-parent multiplier crosses +1

Below / critical / above: 0.996933347 / 0.999997153 / 1.003084193. All three matrices and 288 perturbed return maps passed.

The critical multiplier differs from 1 by less than its last finite-difference change. This is empirical numerical resolution, not an exact-equality claim.

The stored height-minimum orbit was shifted by $T/4$ to a genuine downward apex; the full labeled contact cycle and acceptance gates were preserved.

B Numerical resolution at the critical orbit
